

5. (10 分) 求满足函数方程:

$$\int_0^x t f(t) dt = \frac{1}{2} x \int_0^x f(t) dt$$

的连续函数 $f(x)$.

$$\text{令 } F(x) = 2 \int_0^x t f(t) dt - x \int_0^x f(t) dt \equiv 0$$

$$F'(x) = 2x f(x) - \int_0^x f(t) dt - x f(x) \equiv 0$$

$$G(x) = x f(x) - \int_0^x f(t) dt \equiv 0 \Rightarrow f(x) \text{ 为常数}$$

$$G'(x) = f(x) + x f'(x) - f(x) \equiv 0 \Rightarrow x f'(x) \equiv 0$$

$$\text{故 } f(x) \equiv c \text{ 此时 } \int_0^x t f(t) dt = \frac{1}{2} c x^2 \quad \frac{1}{2} x \int_0^x c dt = \frac{1}{2} c x^2 \text{ 成立}$$

6. (10 分) 设函数 $f(x)$ 在区间 $[0, 1]$ 上有连续的导函数, 且 $f(0) = 0$. 求证:

$$\int_0^1 |f(x)|^2 dx \leq \frac{1}{2} \int_0^1 (1-x^2) |f'(x)|^2 dx,$$

等号成立当且仅当 $f(x) \equiv cx$, 其中 c 为常数.

$$\int_0^1 |f(x)|^2 dx = \int_0^1 \left(\int_0^x f'(t) dt \right)^2 dx \quad (*)$$

$$f(x) = \int_0^x f'(t) dt \text{ 由 } f(0) = 0$$

$$\left(\int_0^x f'(t) dt \right)^2 \stackrel{\text{Cauchy}}{\leq} \int_0^x 1 dt \int_0^x (f'(t))^2 dt \quad \text{与 } f'(x) \text{ 有关}$$

$$= x \int_0^x (f'(t))^2 dt$$

$$\text{故 } (*) \leq \int_0^1 x \left(\int_0^x (f'(t))^2 dt \right) dx$$

$$= \frac{1}{2} \int_0^1 \left(\int_0^x (f'(t))^2 dt \right) dx^2$$

$$\stackrel{\text{分部}}{=} \frac{1}{2} \left(x^2 \int_0^x (f'(t))^2 dt \right) \Big|_{x=0} - \int_0^1 x^2 d \left(\int_0^x (f'(t))^2 dt \right)$$

$$= \frac{1}{2} \left(\int_0^1 (f'(t))^2 dt - \int_0^1 x^2 (f'(x))^2 dx \right) = \frac{1}{2} \int_0^1 (1-x^2) (f'(x))^2 dx$$

5. (10 分) 设 $f(x)$ 是定义在 $(-\infty, +\infty)$ 上满足函数方程

$$\int_0^x t f(t) dt = (x-1) \int_0^x f(t) dt$$

的连续函数. 求证: $f(x) \equiv 0$.

$$\text{令 } F(x) = \int_0^x t f(t) dt - (x-1) \int_0^x f(t) dt, \text{ 则 } F'(x) \equiv 0$$

$$F'(x) = x f(x) - (x-1) f(x) - \int_0^x f(t) dt$$

$$= f(x) - \int_0^x f(t) dt \equiv 0$$

$$G(x) = \int_0^x f(t) dt, \text{ 则 } G'(0) = 0.$$

$$G'(x) - G(x) = 0 \quad (e^{-x} G(x))' = 0 \quad e^{-x} G(x) \equiv C \quad \text{由 } G'(0) = 0 \quad \text{得 } C = 0.$$

$$G(x) \equiv 0, \text{ 故 } \int_0^x f(t) dt \equiv 0, \quad f(x) \equiv 0$$

6. (5 分) 设 $f(x)$ 是闭区间 $[0, 1]$ 上满足 $f(0) = f(1) = 0$ 的连续可微函数, 求证不等式

$$\left(\int_0^1 f(x) dx \right)^2 \leq \frac{1}{12} \int_0^1 |f'(x)|^2 dx,$$

等号成立当且仅当 $f(x) \equiv Ax(1-x)$, 其中 A 为常数.

$$f'(x) \propto 1-2x$$

证1: 这里考虑用 $\frac{1}{2}-x$ 是 Cauchy 积分不等式成立时与 $f'(x)$ 线性相关

$$\left(\int_0^1 f(x) dx \right)^2 = \left(\int_0^1 f(x) d(x - \frac{1}{2}) \right)^2$$

$$= \left(\frac{f(x)(x - \frac{1}{2})}{0} - \int_0^1 (x - \frac{1}{2}) f'(x) dx \right)^2$$

$$= \left(\int_0^1 (x - \frac{1}{2}) f'(x) dx \right)^2 \leq \int_0^1 (x - \frac{1}{2})^2 dx \int_0^1 |f'(x)|^2 dx$$

$$= \frac{1}{12} \int_0^1 |f'(x)|^2 dx$$

证2: «积分不等式葵花宝典» P7

06 - 07

6. (15 分) 设 $f(x)$ 在区间 $[0, 1]$ 上非负连续可微, $f(0) = f(1) = 0$, 且 $|f'(x)| \leq 1$. 求证:

$$\int_0^1 f(x) dx \leq \frac{1}{4},$$

又问上面的不等式是否可能成为等式, 为什么?

$$\begin{aligned} \left| \int_0^1 f(x) dx \right| &= \int_0^{\frac{1}{2}} |f(x)| dx + \int_{\frac{1}{2}}^1 |f(x)| dx \\ &= \int_0^{\frac{1}{2}} (|f(x)| - |f(0)|) dx + \int_{\frac{1}{2}}^1 (|f(x)| - |f(1)|) dx \\ &\leq \int_0^{\frac{1}{2}} x dx + \int_{\frac{1}{2}}^1 (1-x) dx = \frac{1}{4}. \end{aligned}$$

07 - 08

7. (10 分) 设函数 $f(x)$ 在 $[0, +\infty)$ 上连续且满足

$$|f(x)| \leq e^{kx} + k \int_0^x |f(t)| dt,$$

非负常数.

其中 k 是常数. 求证: $|f(x)| \leq (kx+1)e^{kx}$.

右则 $x > -\frac{1}{k}$ 时为证, 故 $|f(x)| \geq 0$

$$\text{令 } F(x) = \int_0^x |f(t)| dt \quad F'(x) \leq e^{kx} + kF(x), \text{ 则}$$

$$(F'(x) - kF(x))e^{-kx} \leq 1 \quad (F(x)e^{-kx})' \leq 1$$

故 $F(x)e^{-kx} - x$ 单调递增, 由 $F(0) = 0$, 故

$$F(x)e^{-kx} - x \leq 0.$$

$\therefore k \geq 0$, 则 $\uparrow$ 且 > 0 $\downarrow$ 且 < 0

$$e^{kx} [F(x)e^{-kx} - x] \text{ 单调递增} \quad (F(x) - xe^{kx})' \leq 0$$

$$|f(x)| \leq (kx+1)e^{kx}$$

$\therefore k < 0$, 则 $f(x) \equiv 0$. $k = -1$, 则

$$0 \leq e^{-x} - \int_0^x 0 dt = e^{-x} \text{ 成立}$$

而 $0 \leq (-x+1)e^{-x}$ 当 $x > 1$ 时不成立.

11 - 12

8. (10 分) 设 $f(x)$ 在区间 $[0, 1]$ 上有连续的导函数且 $f(0) = 0, f(1) = 1$. 求证:

$$\int_0^1 |f(x) + f'(x)| dx \geq 1.$$

$$\begin{aligned} e = e^{f(x)} \Big|_0^1 &= \int_0^1 e^{f(x)} (f'(x) + f'(x)) dx \leq \int_0^1 e^{f(x)} |f'(x) + f'(x)| dx \\ &\leq e \int_0^1 |f'(x) + f'(x)| dx \end{aligned}$$

$$\text{故 } \int_0^1 |f'(x) + f'(x)| dx \geq 1$$

12 - 13

7. (8 分) 设 $f(x)$ 是在 $[0, 1]$ 上非负单调递增的连续函数, $0 < \alpha < \beta < 1$. 求证:

$$\int_0^1 f(x) dx \geq \frac{1-\alpha}{\beta-\alpha} \int_\alpha^\beta f(x) dx,$$

且 $\frac{1-\alpha}{\beta-\alpha}$ 不能换为更大的数.

$$\text{证 1: 令 } g(t) = \int_0^t f(x) dx - \frac{1-t}{t-\alpha} \int_\alpha^t f(x) dx$$

$$g'(t) = -\frac{1-t}{t-\alpha} f(t) - \frac{-(1-t)}{(t-\alpha)^2} \int_\alpha^t f(x) dx$$

$$\stackrel{\text{恒比}}{\sim} -\frac{1}{t-\alpha} f(t) + \frac{1}{(t-\alpha)^2} \int_\alpha^t f(x) dx$$

$$= \frac{1}{(t-\alpha)^2} \left[\int_\alpha^t f(x) dx - (t-\alpha) f(t) \right] \leq 0$$

$$\text{故 } g'(t) \leq 0 \Rightarrow g(t) \downarrow \quad g(1) = \int_0^1 f(x) dx - \int_\alpha^1 f(x) dx \geq 0. \quad \text{故 } g(t) \geq 0$$

$$\text{证 2: } \int_0^1 f(x) dx \geq \int_\alpha^\beta f(x) dx = \left(\int_\alpha^\beta + \int_\beta^1 \right) f(x) dx$$

$$\int_0^1 f(x) dx - \frac{1-\alpha}{\beta-\alpha} \int_\alpha^\beta f(x) dx \geq \left(1 - \frac{1-\alpha}{\beta-\alpha} \right) \int_\alpha^\beta f(x) dx + \int_\beta^1 f(x) dx$$

$$= \frac{\beta-1}{\beta-\alpha} \int_\alpha^\beta f(x) dx + \int_\beta^1 f(x) dx \geq \frac{\beta-1}{\beta-\alpha} (1-\alpha) f(\beta) + (1-\beta) f(\beta) = 0$$

↓

下证 $\frac{1-\alpha}{\beta-\alpha}$ 为最佳.

考虑 $f_n(x) = \begin{cases} 0 & x \in [0, \alpha] \\ n(x-\alpha) & x \in [\alpha, \alpha + \frac{1}{n}] \\ 1 & x \in [\alpha + \frac{1}{n}, 1] \end{cases} \quad n \geq 1, \frac{1}{\beta-\alpha}$. 则

$$\frac{\int_0^1 f_n(x) dx}{\int_0^1 f_n(x) dx} = \frac{1-\alpha-\frac{1}{n}+\frac{1}{2n}}{\beta-\alpha-\frac{1}{n}+\frac{1}{2n}} = \frac{1-\alpha-\frac{1}{2n}}{\beta-\alpha-\frac{1}{2n}} \rightarrow \frac{1-\alpha}{\beta-\alpha}$$

13-14

8. (10 分) 设 $f(x)$ 在 $\mathbb{R}$ 上有二阶导函数, $f(x), f'(x), f''(x)$ 都大于 0, 假设存在正数 a, b , 使得 $f''(x) \leq af(x) + bf'(x)$ 对一切 $x \in \mathbb{R}$ 成立. 求证:

(1) $\lim_{x \rightarrow -\infty} f'(x) = 0$;

(2) 存在常数 c , 使得 $f'(x) \leq cf(x)$.

(1) 由 $f(x), f'(x), f''(x) > 0$ 知 f, f' 均单调递增. 因此 $\lim_{x \rightarrow -\infty} f(x)$ 和 $\lim_{x \rightarrow -\infty} f'(x)$ 均存在. 对 $\forall x \in \mathbb{R}$, $\exists \theta x \in (0, 1)$. $f'(x+\theta x) - f'(x) = f''(x+\theta x) \cdot \theta x > f'(x) > 0$

令 $x \rightarrow -\infty$, 则 $f'(x+\theta x) - f'(x) \rightarrow 0$. 故 $f'(x) \rightarrow 0$

(2). $f''(x) = af(x) + bf'(x)$ 的解方程 $t^2 - bt - a = 0$

取 $c = \frac{b + \sqrt{b^2 + 4a}}{2}$, 则 $c > b > 0$, 且 $\frac{a}{b-c} = -c$.

$$f''(x) - cf'(x) \leq (b-c)f''(x) + af(x) = (b-c)[f''(x) - cf'(x)]$$

故 $e^{-(b-c)x} [f''(x) - cf'(x)]$ 单调递减

$$\lim_{x \rightarrow -\infty} e^{-(b-c)x} [f''(x) - cf'(x)] = 0 \quad \text{故} \quad e^{-(b-c)x} [f''(x) - cf'(x)] \leq 0$$

$$f'(x) \leq cf(x)$$

15-16

6. (12 分) 设 $f(x)$ 在 $\mathbb{R}$ 上连续, 且满足方程 $f(x+a) = -f(x)$. 求证:

$$\int_0^{2a} xf(x) dx = -a \int_0^a f(x) dx.$$

$$\int_0^{2a} xf(x) dx = \int_0^a xf(x) dx + \int_a^{2a} xf(x) dx$$

$$= \int_0^a xf(x) dx + \int_0^a (x+a)f(x+a) dx$$

$$= \int_0^a xf(x) dx - \int_0^a (x+a)f(x) dx = -\int_0^a af(x) dx$$

7. (8 分) 设 $f(x)$ 在 $[0, 1]$ 上连续, 且 $0 \leq f(x) \leq 1$. 求证:

$$2 \int_0^1 x f(x) dx \geq \left(\int_0^1 f(x) dx \right)^2,$$

并求使上式成为等式的连续函数.

$$F(t) = 2 \int_0^t x f(x) dx - \left(\int_0^t f(x) dx \right)^2, \quad 0 \leq t \leq 1$$

$$F'(t) = 2tf(t) - 2 \int_0^t f(x) dx \cdot f(t) = 2f(t) \left[t - \int_0^t f(x) dx \right] \geq 0$$

故 $F(t)$ 单调递增, 当 $t=0$ 时 $F(0)=0$, 故 $F(t) \geq 0$.

当 $f(x) \equiv 1$ 时满足等式

17-18

4. (10 分) 设 $f(x)$ 是在 $\left[0, \frac{\pi}{2}\right]$ 上非负单调递增的连续函数. 求证:

$$x \int_0^x f(t) \sin t dt \geq (1 - \cos x) \int_0^x f(t) dt, \quad 0 \leq x \leq \frac{\pi}{2}.$$

法 1: 见 17 年答案

法 2: 1.11 Chebyshev 不等式

定理 1.10 若函数 $f(x), g(x)$ 是 $[a, b]$ 上的连续函数, 且 $f(x), g(x)$ 在 $[a, b]$ 上单调性一致, 则有

$$\int_a^b f(x) dx \int_a^b g(x) dx \leq (b-a) \int_a^b f(x)g(x) dx$$

$$1 - \cos x$$

$$\int_0^x f(t) dt \int_0^x \sin t dt \leq x \int_0^x f(t) \sin t dt$$

8. (10 分) 设 $f(x)$ 在 $[0, 1]$ 上有二阶连续导函数, 且 $f(0)f(1) \geq 0$. 求证:

$$\int_0^1 |f'(x)| dx \leq 2 \int_0^1 |f(x)| dx + \int_0^1 |f''(x)| dx.$$

见 17 年答案

18-19

8. (10 分) 设 f 是 $\mathbb{R}$ 上取值为正的可微函数, 且对所有 $x, y \in \mathbb{R}$, 有

$$|f'(x) - f'(y)|^2 \leq |x - y|.$$

求证: 对所有 $x \in \mathbb{R}$, 有 $|f'(x)|^3 < 3f(x)$.

an hour ago

QPM #2

We prove a more general statement: If $\alpha \in (0, 1]$ and we have for all $x, y \in \mathbb{R}$ that $|f'(x) - f'(y)| \leq |x - y|^\alpha$, then it holds for all $x \in \mathbb{R}$ that $|f'(x)|^{\frac{1+\alpha}{\alpha}} < \frac{1+\alpha}{\alpha} f(x)$.

Note first that for all $x, y \in \mathbb{R}$ we have that

$$f(y) - f(x) = \int_0^1 (y-x) f'(ty + (1-t)x) dt = f'(x)(y-x) + \int_0^1 (f'(ty + (1-t)x) - f'(x))(y-x) dt.$$

Now, the assumption implies that

$$\left| \int_0^1 (f'(ty + (1-t)x) - f'(x))(y-x) dt \right| \leq |x-y| \int_0^1 t^\alpha |x-y|^\alpha dt = \frac{1}{\alpha+1} |x-y|^{1+\alpha}.$$

Hence, we obtain for all x, y that

$$f(y) \leq f(x) + (y-x)f'(x) + \frac{1}{1+\alpha} |x-y|^{1+\alpha}.$$

Setting here $y = x - |f'(x)|^{\frac{1}{\alpha}-1} f'(x)$ yields

$$0 < f(y) \leq f(x) - |f'(x)|^{\frac{1}{\alpha}+1} + \frac{1}{1+\alpha} |f'(x)|^{\frac{1+\alpha}{\alpha}} = f(x) - \frac{\alpha}{1+\alpha} |f'(x)|^{\frac{1+\alpha}{\alpha}}.$$

This completes the proof.

Estimates like this are often used when analyzing gradient descent type optimization methods. See e.g. Lemma 1 in this article for a generalization.

This post has been edited 1 time. Last edited by Gryphos, an hour ago

取 $\alpha = \frac{1}{2}$ 即可

12-13 第三次测验

5. (10 分) 设 $f(x) \in C[0, 1]$ 且满足 $3 \int_0^1 f^2(x) dx + 1 = 6 \int_0^1 xf(x) dx$. 求证: $f(x) = x$.

不是微分方程, 积分方程, 积分方程, 猜是一个不等式. 用 $f(x) = x$ 代入可验证.
 $f'(x) = 0 \Rightarrow 1 \geq 0$ $f'(x) = 2$ $3 \times 0 + 1$ $6 \times \int_0^1 x dx = 6$.

下证 $3 \int_0^1 f^2(x) dx + 1 \geq 6 \int_0^1 xf(x) dx$ $f(x) = x$ 时取等号.

$(\int_0^1 xf(x) dx)^2 \leq \int_0^1 x^2 dx \int_0^1 f^2(x) dx$ Cauchy 积分不等式. 且
 $= \frac{1}{6} \int_0^1 f^2(x) dx$ 题目用积分
 $\Rightarrow 6 \int_0^1 xf(x) dx \leq 6 \sqrt{\frac{1}{6} \int_0^1 f^2(x) dx}$ $\int_0^1 xf(x) dx$ 类型.
 $= 2\sqrt{3} \sqrt{\int_0^1 f^2(x) dx} \leq 3 \int_0^1 f^2(x) dx + 1$ 基本不等式
 等号成立当且仅当 $f(x) = x$ 且 $2\sqrt{3} \sqrt{\int_0^1 f^2(x) dx} = 1$
 此时 $f(x) = x$. $\uparrow$ 证

13-14 第三次测验

6. (6 分) 设 $f(x), g(x)$ 在 $[a, b]$ 上连续, 且满足

$$\int_a^x f(t) dt \geq \int_a^x g(t) dt \quad (x \in [a, b]), \quad \int_a^b f(t) dt = \int_a^b g(t) dt.$$

证明: $\int_a^b xf(x) dx \leq \int_a^b xg(x) dx$.

设 $F(x) = \int_a^x f(t) dt - \int_a^x g(t) dt = \int_a^x (f(t) - g(t)) dt$, 则:

$$F(a) = F(b) = 0, \quad F(x) \geq 0 \quad \forall x \in [a, b].$$

$$F'(x) = f(x) - g(x)$$

$$\int_a^b xf'(x) dx - \int_a^b xg'(x) dx = \int_a^b x(f'(x) - g'(x)) dx = \int_a^b xF'(x) dx$$

$$= xF(x) \Big|_a^b - \int_a^b F(x) dx = - \int_a^b F(x) dx = -F(\xi)(b-a), \quad \xi \in (a, b)$$

$$\text{因为 } F(\xi) \geq 0, \text{ 所以 } F(x) \leq 0 \quad \text{故 } \int_a^b xf'(x) dx \leq \int_a^b xg'(x) dx$$

7. (6 分) 设 $f(x)$ 在 $[a, b]$ 上连续, 且

$$\int_a^b f(x) dx = 0, \quad \int_a^b x f(x) dx = 0,$$

证明: 至少存在两点 $x_1, x_2 \in (a, b)$, 使得 $f(x_1) = f(x_2) = 0$.

由 $\int_a^b f(x) dx = 0$ 知存在 $\xi \in (a, b)$, s.t. $f(\xi) = 0$. 若只知有 ξ 一个零点, 则不妨设 $f(x) > 0, \forall x \in (a, \xi), f(x) < 0, \forall x \in (\xi, b)$.
 则 $\int_a^b x f(x) dx = \xi \int_a^b f(x) dx = 0$.

$$\int_a^b (x - \xi) f(x) dx = 0 \quad \text{矛盾, 且两边均恒为正}$$

15-16 第三次测验

5. (8 分) 设 $f(x)$ 在 $[a, b]$ 上有连续导函数, 证明:

$$\max_{a \leq x \leq b} |f(x)| \leq \frac{1}{b-a} \left| \int_a^b f(x) dx \right| + \int_a^b |f'(x)| dx.$$

$$\int_a^b f(x) dx = (b-a) f(\xi), \quad \xi \in [a, b] \quad \text{不妨 } x < \xi$$

$$\begin{aligned} \int_a^b |f'(x)| dx &\geq \int_x^\xi |f'(x)| dx \geq \left| \int_x^\xi f'(x) dx \right| = |f(\xi) - f(x)| \\ &\geq |f(x)| - |f(\xi)| \end{aligned}$$

$$\text{故 } |f(x)| \leq |f(\xi)| + \int_a^b |f'(x)| dx$$

$$= \frac{1}{b-a} \left| \int_a^b f(x) dx \right| + \int_a^b |f'(x)| dx$$

16-17 第三次测验

8. (10 分) 设 $f(x)$ 在 $[0, 1]$ 上有连续的一阶导数, $f(0) = 0$, $f(1) = 1$, 且 $f'(x) - f(x)$ 在 $[0, 1]$ 上不变号. 证明:

$$\int_0^1 (f'(x) - f(x)) dx > \frac{1}{e}.$$

$$\frac{1}{e} = f(x) e^{-x} \Big|_0^1 = \int_0^1 (e^{-x} f(x))' dx = \int_0^1 e^{-x} (f'(x) - f(x)) dx \leq \int_0^1 (f'(x) - f(x)) dx$$

由于 $\int_0^1 e^{-x} (f'(x) - f(x)) dx = \frac{1}{e}$, $f'(x) - f(x)$ 不变号

故 $f'(x) - f(x)$ 恒为正

等号成立当且仅当 $f'(x) - f(x) \equiv 0$, 也 $\frac{1}{e} = \int_0^1 e^{-x} (f'(x) - f(x)) dx$ 矛盾
